#Part 4: Reflection:

#Frankly, the assignment was a bit challenging because I fell behind during last week's class instructions, but after revisiting the PDF and following the steps, everything made more sense.

#The easiest part of the exercise was creating and editing the R script since I am already familiar with basic R programming. I now have a better understanding of how Git tracks changes to files over time. The most confusing part was understanding the workflow of staging, committing and pushing changes because those steps initially seemed very similar. The assignment helped immensely to learn that changes must first be made to a file, then staged, committed with a message and finally pushed to GitHub. I also learned how to verify that changes are synced between RStudio and GitHub. Overall, this exercise greatly improved my understanding and confidence of Git and GitHub and showed me how they can be used to organize, track and collaborate on projects/files.
